SUMMARY

This report entitled “**Butterflies of Meghalaya**” is based on a four year study conducted in different localities of the four major districts of Meghalaya – Ri-Bhoi, Khasi, Jaintia and Garo Hills. This work was initially started by a group of four people – Atanu Bora, Laishram Ricky Meitei, Sachin Sharma and Ngangom Aomoa for the first three years from September, 2012 to March, 2015. For the last one year study, the project was funded by the Meghalaya Biodiversity Board in terms of a Research Grant (Short-Term) awarded to Atanu Bora on 15th May, 2015.

The report presents an Annotated Checklist of Butterflies of Meghalaya reporting a total of 514 species distributed under 6 families of the order Lepidoptera. The study also able to reveal the District-wise diversity and distribution of each species of butterflies. An effort was made to identify the major butterfly rich areas of Meghalaya and a list of localities was included showing their respective coordinates and elevations. A list of schedule species as per Indian Wildlife Protection Act, 1972 is also attached in this report. The study reports 11 species that are listed under Red Data Book, IUCN.

Sampling method

Pollard walk was followed on fixed transects for a period of four consecutive years from September, 2012 to November, 2016 in three different seasons (Pre-Monsoon, Monsoon and Post-Monsoon) covering all above localities (Table. 1). We followed a transect size that varies from 1000-2000 m length but most often this size increases near the hill streams. Our field work usually took place from 8.00am to 3.30pm every day. However additional surveys normally after 4.00pm were also done to sample the Coeliadinae group of Hesperiidae butterflies that includes the twilight skippers – Awls, Awlets and Awlkings. In each season, after the transect sampling was done, surveys were conducted for special species in the areas invaded by elephants and other animals outside our transect area. During our survey period, we paid particular attention in the areas that have a fairly high turnover of butterflies and most often these areas include hill streams, mud-puddling patches, nectering flowers and bamboo plantations. Photographic documentation using Digital SLR cameras were done for all the butterflies and to assist in proper identification, an effort was made to photograph the species from as many angles as possible (as some butterflies need both under and upper wing image for proper identification). We also followed a capture and release method for those butterflies which are not easy to identify based on only photographic records. Other factors noted include the time of day using a twenty-four hour clock and the weather conditions.

For proper identification and nomenclature, an attempt was made to use the latest guides and literatures available: Kehimkar (2008, 2016), Varshney & Smetacek (2015), Paul Van Gasse (2013), Kunte *et al.*, (2012), WPA (1972), Eliot (1969) and Evans (1932, 1949).
